

# Inventory of linear with woody vegetation which induce risks around buildings and structures

Isolated trees or linear woody vegetation implanted around structures as private and public gardens, parks and green spaces, cemeteries, roadways and pavements, industrial areas, military place, port and airport areas, leisure and sport places, linear structure of transport, railways, waterways and energy transport networks, create risks for users.

It is important to identify dangerous trees and to treat them urgently for security reasons.

ARBEAUSOLUTIONS performs support missions which include a detailed woody trees inventory, a risk assessment, a tree classification according to their dangerousness and delivers a management plan, sectoring and prioritizing operations.

Work planning includes environmental impact assessment and takes into account current regulations about protected spaces (Natura 2000, etc.). On very sensitive areas, ARBEAUSOLUTIONS proposes a reduction of the impact actions and works in collaboration with naturalists who realize a detailed inventory of fauna.
