

# Environmental monitoring of the work sites

Respect and maintenance of biodiversity are priorities for ARBEAUSOLUTIONS company in addition to their expertise of hydraulic structures. These linear works often constitute important ecological corridors allowing fauna and flora to make their life cycle.

Realization of maintenance and construction sites may have more or less important impact on existing ecosystems. ARBEAUSOLUTIONS company proposes to make environmental monitoring of the maintenance works and construction sites.

After the study of possible avoidance and reduction actions to set up, our team will take care of the environmental monitoring of the construction sites and will ensure the smooth functioning of the operation from an environmental point of view, sensitizing construction management firms.

ARBEAUSOLUTIONS will also sensitize residents, associations, managers with communications via technical days, verbal briefing or information boards in order to inform them of set up solutions to minimize environmental impacts.
